PROFILE

AI product lead with nearly two years in machine learning products and AI operations. At Data Pixel, led MLense, a no-code AutoML platform, from roadmap to production launch on Google Cloud in 12 weeks, managing 2 developers and a 5-person marketing agency. Now at Amazon, checking about 5,000 multimodal training data points a month, and author of a cross-team proposal to fix how resolved issues reach 4 teams. MSc Big Data Science (Distinction). Targeting AI Product Owner, AI Product Manager and AI Adoption roles.

CORE SKILLS

AI Product Management: product ownership, roadmap and prioritisation, MVP scoping, sprint planning and acceptance criteria, change requests, user feedback loops, user documentation

AI Operations and Data Quality: multimodal annotation (audio, video, image, text), audited quality and handling-time targets, edge-case resolution, annotation conventions

Process Improvement and Change: turning business needs into requirements, impact analysis, implementation planning, pilot-first rollout

Stakeholders and Clients: requirements gathering, client demos, presentations for technical and non-technical audiences, onboarding and mentoring, ML engineering teams

Go-to-Market: target-user definition, go-to-market planning, subscription pricing

AI Literacy: generative AI and LLMs (Gemini, GPT, LLaMA), AutoML, LLM-based text scoring, AI output evaluation

Tools: Excel, PowerPoint, Asana, Notion, Slack, Microsoft Teams, ChatGPT, Claude

PROFESSIONAL EXPERIENCE

Senior ML Data Associate II | Amazon, Cambridge, UK 11/2025 – Present

- Annotate and quality-check about 5,000 multimodal training data points a month (audio, video, image and text transcription) for machine learning models, within audited quality and handling-time targets.
- Spotted that resolved SIM (issue-resolution) tickets took too long to reach the convention pages teams work from, and proposed linking each SIM to its task on the page so every team works from one current source of guidance.
- Built the change plan behind it: impact and benefits mapped for 4 teams, a 6-step implementation plan, a pilot on 1 live workflow before full rollout, and a low-build alternative. Under review; estimated 80 to 85% gain in how well guidance is shared.
- Gave managers a feedback loop in the same proposal: with SIMs visible during L1 audits, tasks that cause repeated overturns show up early and can be fixed for the whole team in a huddle.
- Resolve edge cases that fall outside the annotation guidelines and escalate findings that update team-wide conventions; specialist in sports data, including tennis and volleyball.
- Work with ML and AI engineers, the Quality team and Privacy managers to keep annotation output matched to model performance and compliance requirements.
- Onboarding buddy for new Data Associates, helping them through their first days on the systems and processes; mentored A-level students on an Amazon work programme. Recognised by the team for going above and beyond.

AI Product Lead | Data Pixel Ltd, London, UK 11/2024 – 11/2025

UK start-up that built no-code AI tools for business users. Product: MLense (mlense.com).

- Owned the MLense AI product, a no-code AutoML platform covering 7 machine learning task types that lets business analysts and domain experts train and explain models in the browser without coding; led 2 developers and a 5-person marketing agency.
- Built the roadmap around a problem seen first-hand, slow model building, and shipped a working MVP in month one.
- Ran delivery in 6 two-week sprints over 12 weeks, each with agreed scope and acceptance criteria, taking the platform from proof of concept (v0.1) to production launch on Google Cloud (v1.0).
- Defined the AI features that set MLense apart: Gemini-powered recommendations that pre-build a model pipeline from an uploaded dataset, and an assistant that explains results in plain English.
- Made the product self-serve with 4 pipeline templates from beginner to expert, an in-platform documentation portal, an in-app feedback centre for bug reports and feature requests, and an admin dashboard to review them.
- Launched with 70 automated tests passing and 6 security issues fixed; ran client demos and logged every change request in writing, from new features to UX fixes.
- Defined 3 target segments, led by business analysts and domain experts without coding skills, and wrote a 5-phase go-to-market plan, from LinkedIn content to performance partners, with Pro and Team pricing planned at US$29 and US$99 a month after a free launch.

Business Analyst Intern | Satv-Script, India 03/2023 – 04/2023

- Mapped use cases for a client's existing product and turned the findings into written summaries and presentations for the client team.

EDUCATION

MSc Big Data Science, Distinction | Queen Mary University of London 09/2023 – 09/2024

- Dissertation, Multimodal AI for Predicting the Success of Content Creation: predicted YouTube view counts from metadata and LLM-scored transcripts across 500 hand-collected videos, with 79% lower average error than a metadata-only baseline.
- Designed an 11-question LLM scoring framework (clarity, engagement, credibility and more) that turned transcripts into model features.
- Compared 3 approaches and showed that the LLM-scored model beat both the metadata-only baseline and a visual-only deep learning model.

B.Tech Computer Engineering, First Class with Distinction | Atmiya University, India 08/2019 – 03/2023

CERTIFICATIONS

edX Verified Certificate: Introduction to Data Science 07/2021

ADDITIONAL INFORMATION

Languages: English, Hindi and Gujarati (native)

Writing: author of The Unveiled Verses and compiler of Coffee Romance; featured 5 times as an author in a national Indian magazine

Community: organised 2 open-mic events in India (50+ participants)

Interests: tennis, baking, fashion and hosting games nights
